Annotations:**1. Explanatory Notes**

Consumer Price Index (CPI) is an index measuring changes over time in the price level of consumer goods and services purchased by residents, which comprehensively reflects the changes of price level.

2. Statistical Coverage

Consumer Price Index (CPI) covers the prices of goods and services of 8 categories and 268 basic divisions which cover the living consumption of urban and rural residents, including food, tobacco and liquor; clothing; residence; household articles and services; transportation and communication; education, culture and recreation; health care; other articles and services.

3. Survey Methods

According to the principle of "fixed person, fixed point and fixed time", people are directly sent to the survey sites or collect the original price from the Internet. The data comes from about 500 cities and counties in 31 provinces (autonomous regions and cities) and nearly 100000 price survey points, including shopping malls (stores), supermarkets, farmers' markets, service outlets and Internet e-commerce.

4. Data Description

Due to "rounding-off", sometimes the aggregate data is the same as the high or low value of the classified data.

5. Base Period Rotation

According to the regulations of the statistical system, China's CPI has a base period rotation every five years. In January 2021, CPI with 2020 as the base period will be compiled and released. Compared with the last round of the base period, the survey classification catalogue, representative specifications and survey outlets in the new base period have been adjusted, and the classification weight has also changed to reflect the latest changes in the consumption structure of residents. It is estimated that the average impact of the base period rotation on the CPI year-on-year index is about 0.03 percentage point.
